TITLE: Bulkied yarn fabrics

SOURCE: Tekstil' naya promyshlennost' , no. 4, 1966, 15-17

TOPIC TAGS: synthetic fiber, orlon, acrilon, exlan, courtell, nitron, lavsan, polyacrylonitrile, bulkied yarn

ABSTRACT: The Leningrad Scientific Research Institute for the Textile Industry has created new imitation-~~wool~~ bulk fabrics made from nonstabilized yarns containing corded fibers of polyacrylonitrile and polyester synthetics (orlon, acrilon, exlan, courtell, nitron, lavsan) and yarns made of spun fibers ("B" nitron and

15

Card 1/3

L 45277-66

ACC-NR: AP6023234

nitron, a pure polymer of irregular shrinkage. The fabric was bulked by irregular shrinkage of the fibers during heat treatment. The author describes the properties of the fabrics made from nonstabilized bulked yarn, processed from twisted orlon and gives a detailed description of the properties of the yarn used. The data given show that the yarn is of high and relatively uniform strength and, therefore, breaks infrequently during weaving. The use of twisted yarn made sizing unnecessary. Table 1 in the original article shows the weaving characteristics of the sample fabrics, finished at the V. Slutskaya and "Lensukno" mills. Table 2 shows the properties of some unfinished and finished samples. Fabrics made of nonstabilized yarn, produced from corded polyacrylonitrilic and polyester fibers were developed by the authors with the assistance of associates of the Zhelyabov Mill. Table 3 shows the properties of acrilon, exlans, courtell, nitron and lavsan of samples. The shrinkage of nitron samples during heat treatment was lower than for orlon fabrics. Fabrics made from nonstabilized yarn, produced from a blend of spun fibers of irregular shrinkage used nonstabilized No 54/2 (18.5 Text. x 2) fibers, containing "B" nitron and pure-polymer nitron. Samples of the three types of fabrics were produced at the Zhelyabov Weaving Mill, and the sample made from yarn containing 50% nitron (both types) was found to be the best. The tests carried

Card 2/3

ACC NR: AP6023234

out showed that the outlooks for the use of various highly shrinkable fibers to produce bulked fabrics are promising and that research to develop such fabrics should continue. Orig. art. has: 3 tables. [GC]

TITLE:

On Some Properties of Ammoniates on the Basis of Ammonium Nitrate and Urea

PERIODICAL:

Khimicheskaya promyshlennost', 1959, Nr 6, pp 507 - 509 (USSR)

ABSTRACT:

The mutual solubility of the components of the system $\text{NH}_4\text{NO}_3 - \text{CO}(\text{NH}_2)_2 - \text{NH}_3 - \text{H}_2\text{O}$ was investigated by means of a special apparatus (Fig 1) at 30 and 0°. In the case of different $\text{NH}_3 : (\text{NH}_3 + \text{H}_2\text{O})$ ratios the investigations were carried out according to the methodology described in the paper by Professor I. R. Krichevskiy (GIAP). Basically, the apparatus consists of two thick-walled test tubes placed one on top of the other and joined by two ducts via a metal head. The ducts can be closed by two valves. One duct serves for the maintenance of the pressure balance between the two test tubes, the second is used to convey the filtered-off solution from one tube into the other. Urea in the filtered-off equilibrium solution was determined by means of the

Card 1/3

On Some Properties of Ammoniates on the Basis of Ammonium Nitrate and Urea 06221
SOV/64-59-6-13/28

urease method developed by Marshal as improved by R. S. Oks (Chernorechenskiy khimicheskiy zavod) (Chernorechenskiy Chemical Plant). The results obtained (Table 1) show that the highest common solubility of 96.9% is reached at 30° (for 70% ammonia water), in which case ammonium nitrate amounts to 53.4%. The mutual solubility of urea and ammonium nitrate in aqueous ammonia solutions was determined at 0° for $\text{NH}_3 : (\text{NH}_3 + \text{H}_2\text{O})$ ratios of 0.2, 0.4, and 0.5 (Fig 2, Table 2), and it was found that in the case of the two latter values complex compounds of the compositions $\text{CO}(\text{NH}_2)_2 \cdot 0.11\text{NH}_3$ (0.4) and $\text{CO}(\text{NH}_2)_2 \cdot 0.25\text{NH}_3$ (0.5), respectively, are formed. The solubility of the salts in the saturated solutions increases at 30° with mounting $\text{NH}_3 : (\text{NH}_3 + \text{H}_2\text{O})$ ratios, which does not hold for 0°, since in this case the complex compounds form. On the basis of the data obtained the compositions of the four ammoniates best suited for agricultural purposes are listed (Table 3). Their vapor pressures were determined on a special apparatus (Fig 3). There are 3 figures, 3 tables,

Kantor, Aleksandr Vasil'yevich

Apparatus and methods of measurement in rocket tests (Apparatura i metody izmereniy pri ispytaniyakh raket) Moscow, Oborongiz, 1963. 519 p. illus., biblio. Errata slip inserted. 6000 copies printed. Reviewers: Znamenskaya, A. M. (Doctor of Technical Sciences); Grosman, B. F. (Engineer); Editor: Brontman, D. K. (Candidate of Technical Sciences); Deputy editor: Shteynberg, G. I. (Engineer); Publishing house editor: Burakova, O. N.; Technical editor: Oreshkina, V. I.

TOPIC TAGS: rocket test, test apparatus, test method, rocket stand test, rocket flight test, radiotelemetry, on board measurement, tracking, unit time service, radio sounding

PURPOSE AND COVERAGE: This book is intended for a wide circle of scientific personnel and engineers concerned with rocket technology. Methods and systems of measurement applicable for stand and flight tests are outlined. Radiotelemetric and on-board measurements are analyzed in detail, as are tracking measure-

Card 1/4

AM4033659

ments, contemporary radiotelemetry and tracking methods, systems of unit time, and different types of stand measurement. The treatment of measurement results is clarified. Along with systems of the analog type, discrete systems of measurement and automation of work on the measurement results from stand and flight tests are analyzed in detail. Different types of apparatus used in testing rockets are described. Part IV and Section 3 of Chapter 2 were written by Engineer S. Ya. Dul'kin. The author expresses his deep gratitude to Engineer B.F. Grosman and Doctor of Technical Sciences A. M. Znamenskaya for their invaluable aid with the manuscript, and to the scientific editor, Candidate of Technical Sciences D. K. Brontman.

microscopically (especially in microscopy) (Chemistry of Polymer
and Scientific Methods) Moscow, 1969. 148 pages. 1999. 378 p.
5,000 copies printed. Series 1175 inserted.

Material source: A.B. Gaidukov (Sov. M.), Doctor of Chemical Sciences;
M.A. Gal'per, Doctor of Chemical Sciences; Ye. S. Chernov, Doctor of Technical
Sciences; V.Y. Pover, Candidate of Technical Sciences; and V.P. Kucharskiy,
Sov. M., 527. Polymer.

Summary: This book is intended for chemists, chemical engineers, and technicians
specializing in the chemistry of polymers.
The book is a collection of papers presented at the 3rdrd International
Symposium on the Chemistry of Organic Matter, and Mining, Geology and
Metallurgy, Moscow, 1967. The book consists of six sections: 1) Synthetic rubber,
2) Properties and analysis of rubber compounds; 3) Synthetic rubber-
plasticizer; 4) Synthesis of rubber compounds in petroleum and petroleum
products; 5) Synthesis of rubber compounds by thermal catalysis;
6) Physicochemical properties of rubber compounds and hydrogels
of the same structure. There are 215 references, 26 tables, 119
illustrations, 5 figures, 12 schemes, and 1 cover.

AUTHOR: Kantor, B.Ya.

TITLE: The bending of a plate of variable thickness which has the form of a circular rectangle and is clamped along the smaller boundary of the arc

PERIODICAL: Referativnyy zhurnal Matematika, no. 7, 1961, 34-35, abstract 7 V 229. ("Prikl. mekhanika", 1960, 6, no. 4, 420-428)

TEXT: The author describes an approximate method for the calculation of the bending of cantilever plates of a variable bending resistance. In this method the integro differential equation of the equilibrium is replaced approximately by a system of integral equations which then is approximated by a system of algebraic equations. The calculation of concrete plates was carried out with the device "Strela". The results of the calculations of two plates are compared with experimental results. ✓

TITLE: Calculation of critical velocities of multiple-rest rotors with a variable cross-section by means of the "Strela" computer

PERIODICAL: Vestnik mashinostroyeniya, ⁴⁰no. 11, 1960, 7-10

TEXT: The calculation of natural critical velocities of multiple-rest rotors with a variable mass and rigidity is of great importance in the design of turbines, power generators, etc. In the general practice of design offices various approximated calculation methods are used, since precise calculation is a very laborious process. Therefore, the application of high-speed digital computers has been suggested. In a book, written by B. M. Kagan and T. M. Ter-Mikaelyan (Ref. 4: Resheniye inzhenernykh zadach na avtomaticheskikh vychislitel'nykh mashinakh/Solution of Engineering Problems by Automatic Computers/Gosenergoizdat, 1958) the calculation of the critical velocities of a twin-rest rotor with elastic supports by means of the BESM computer has been described. The present study contains methods and logical programming schemes for the determination of critical velocities of multiple-rest rotors with rigid supports developed by means

Card 1/6

of the "Strela" computer of the computing center of the AS USSR. The program is based on the conventional integration calculus by parts of the differential equation

$$\frac{d^4}{dx^4} \left[EJ(x) \frac{d^2 y}{dx^2} \right] - m(x) \omega^2 y = 0, \quad (1)$$

- where: E -- the elasticity modulus
- J(x) -- the inertia moment of the rotor cross section
- m(x) -- mass per unit of length
- ω -- circumferential vibration frequency
- y -- flexural amplitude of the rotor axis

This method is quoted from a study by M. A. Proh (Ref. 3: A general method for the calculation of critical speeds of flexible rotors, "J. of Appl. Mech.", Sep. 1945.) In the calculus, the four boundary conditions have to be observed. For the integration of the equation (1) an approximate calculation scheme is used (Fig. 1a) which is easily obtained by dividing the rotor into a series of parts and reducing the mass of each part to its ends in such a way that the position of the center of gravity is not changed. The rotor parts between the concentrated masses were considered weightless rods with a flexural rigidity equal to the mean rigidity of the corresponding part of the actual rotor. Integration within the limits

In connection with the use of the "Strela" computer for the numerical integration of the problem according to an elaborate logical programming scheme, some basic specifications of the computer are given: operational capacity averaging up to 2,000 arithmetic and logic operations per second; numbers are represented in a binary system with a floating comma; the system of orders is a three-address type; the memory capacity comprises 2,048 locations. Basic programming procedures are described, while details of the programming technique have been omitted. The program contained 130 orders for the calculation of any necessary number of natural critical vibration frequencies of rotors with an arbitrary number of rests (shafting spans) and parts in these spans. The following numerical input data were used: number of shafting spans; number of parts (sections) in each span; number of natural frequencies which must be determined; a table with values for the length of the parts Δx ; the mass of the points m and the flexibilities of the parts. The table and the flexibility values have been arranged manually in a short period of time while programming of the same would have been too cumbersome. Having changed several orders of the program permitted of taking into consideration the gyroscopic effect of a massive disc put on the console end of the rotor. The program has been successfully used by the Khar'kovskiy turbinnyy zavod im. S. M. Kirova

(Khar'kov Turbine Plant im. S. M. Kirov) for the calculation of the shaft line of steam turbines. The calculations were carried out by the "Strela" computer of the Computing Center of the AS USSR. Figure 3 was drawn in accordance with results obtained from the calculation of an 8-rest shaft line of a 300,000 k-w steam turbine, a project of the above-mentioned KhTZ (Khar'kov Turbine Plant); the calculation scheme contained 57 parts. The following rates were accepted: $\omega_0 = 80^1/\text{sec}$; $\Delta\omega = 10^1/\text{sec}$. The first four critical velocities were determined. The following values were obtained: $\omega_{kpI} = 136.5^1/\text{sec}$; $\omega_{kpII} = 208^1/\text{sec}$; $\omega_{kpIII} = 248^1/\text{sec}$ and $\omega_{kpIV} = 420^1/\text{sec}$. The computer calculation took 2.5 minutes. The work was carried out in the Laboratory of Hydraulic Machines of the AS UkrSSR under the Corresponding Member of the AS UkrSSR A. P. Filipov, in charge of the project.

AUTHORS: Kantor, B.Ya., and Filippov, A.P. (Khar'kov)

TITLE: Analysis of bending of a circular segment shaped plate of variable thickness clamped along a portion of its arcuate edge, utilising a fast computer

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye tekhnicheskikh nauk. Mekhanika i mashinostroyeniye, no.1, 1962, 121-124

TEXT: Making the usual assumptions for a thin plate, a plate of variable thickness is assumed to be subjected to a distributed load, to be clamped along a portion of its arcuate edge, and to be free over the remainder of the arcuate edge. The potential energy of the bent plate is expressed in polar coordinates, and a set of equations is derived in terms of the local thickness and pressure. Three sets of functions have to be solved, and the methods employed were specifically adapted for use with the computer "Strela". The sub-programme of differentiation was framed in terms of powers of polynomials, X

Card 1/3

Analysis of bonding of a circular ... S/179/62/000/001/015/027
E114/E181

which led to exact solutions. Since it is convenient to express the thickness of the plate and its loading in the form of a Table, the programme included approximate integration over the area of the plate utilising R. Cotes' formula. To obtain an adequate accuracy of integration, a sufficiently fine grid was drawn by dividing each of the three sections of the plate radially into ten equal parts. By proving that certain terms are equal to zero the computer time was significantly reduced. The computer was next used to calculate deflections and stresses in the plate by feeding into it a matrix of the thickness of the plate and of its loading, as well as the information about the coordinate functions. The programme was in three parts. The first part calculated the top right portion of the matrix and the right part of the system, and recorded the information on a magnetic tape. Next, the computer solved systems of equations for each nodal point of the grid. In the third part of the programme, the computer calculated the deflections and stresses. With sixty nodal points and a computer speed of 2000 operations per second, the first part of the programme required one hour and fifty

Card 2/3

Analysis of bending of a circular ... S/179/62/000/001/015/027
E114/E181

minutes, the second six minutes, and the third four minutes.
It follows from a quoted example that sixty nodal points give
adequate accuracy, and that little or nothing is gained from a
finet grid.

There are 6 figures.

B112/B102AUTHOR: Kantor, B. Ye.TITLE: First boundary value (two-point) problem for the equation
 $y'' = f(x, y, y')$ PERIODICAL: Referativnyy zhurnal. Matematika, no. 10, 1962, 38, abstract
10B160 (Uch. zap. Karel'sk. ped. in-t, v. 11, no. 1, 1961,
7 - 24)

TEXT: The two-point boundary value problem

$$y'' = f(x, y, y'); \quad y(a) = y_1, \quad y(b) = y_2 \quad (1)$$

is considered in a class of generalized solutions which represent continuous curves whereon the first derivative is a continuous function with bounded variation. If the function $f(x, y, y')$ is continuous with respect to y and y' for almost all $x \in [a, b]$ that can be measured with respect to x for all y and y' , and if $\varphi_1(x)R(y') \leq f(x, y, y') \leq \varphi_2(x)R(y')$, where

$\varphi_1(x)$ and $\varphi_2(x)$ satisfy the inequalities

Card 1/2

First boundary value...

S/044/62/000/010/004/042
B112/B102

$$\begin{aligned} \tau_1 &= \inf_{(a, b) \subset (a, b)} \int_a^b \varphi_1(x) dx > \\ &> -\tau_0 > -\min \left\{ \int_{-\infty}^{p_0} \frac{dp}{R(p)}, \int_{p_0}^{\infty} \frac{dp}{R(p)} \right\}, \\ \tau_2 &= \sup_{(a, b) \subset (a, b)} \int_a^b \varphi_2(x) dx < \tau_0 < \\ &< \min \left\{ \int_{-\infty}^{p_0} \frac{dp}{R(p)}, \int_{p_0}^{\infty} \frac{dp}{R(p)} \right\}. \end{aligned}$$

where $\tau_0 = \max \{ |\tau_1|, |\tau_2| \}$, p_0 is the coefficient of inflection of a straight line passing through the points $A(a, y_1)$ and $B(b, y_2)$, then the problem (1) will be solvable in the generalized sense. At the end of the paper, the differential properties of the generalized solutions are investigated. [Abstractor's note: Complete translation]

 No. 6, 82-7(1964)).—Vapors of triethylene glycol afford an
 effective disinfection of living space. A 5-min. exposure to
 0.082 g./cu.m. reduces bacterial population by 74% (by
 Koch method) or 91% (by electrostatic pptn. method). If
 the concn. is 0.164 g./cu.m., the reduction is 90-87%. The
 treatment is best done in rooms evacuated of personnel.
